

DETAILS OF THE PROJECT

- Imported Carla using jupyter notebook from terminal.
- Loaded town four, first navigated through the town by using `manual_control.py` in command and driven car through the town.
- Found the x and y co-ordinates by going to the parking place and also the spawning point of the car.
- Used the co-ordinates in the code and used “CARLA AGENTS” to make my car as an agent and made it follow my commands to navigate automatically.
- Made the car go upto the entrance of parking , but couldn't make it go inside the parking.
- Couldn't properly use the waypoints since I'm new to Carla.
